

CONCEPTUAL ASIDE: OPERATORS

OPERATORS:

A SPECIAL FUNCTION THAT IS SYNTACTICALLY (WRITTEN) DIFFERENTLY

Generally, operators take two parameters and return one result

For example we have a code:

```
var a=3 + 4;  
console.log(a);
```

Output of this function will be 7 but here is a **question 'How is JavaScript engine do this means how JS engine will know that if there is a plus sign so I have to plus two numbers?'**

+ Sign is an operator and it is actually a function

It is like:

```
Function+ (a,b){  
  
}
```

But for calling this function we are using In Fix Notation. There is three types of notation:

Pre Fix Notation +(3,4)

Post Fix Notation (3,4)+

In Fix Notation 3+4
